Use Case Scenario

Use Case Scenario: Dispatch Rescue Team During Emergency

Description:

This use case scenario describes how a District Officer dispatches an available rescue team to an affected location during an active disaster and monitors the team's mission status through the emergency response dashboard.

Preconditions:

- An official disaster warning has been escalated and an active disaster event is recorded in the system.
- The affected district and emergency location have been identified.
- Rescue teams are registered in the system with current availability and status information.
- The District Officer can access the Emergency Response Dashboard.

Main Flow:

1. The District Officer opens the Emergency Response Dashboard.
2. The system displays the active disaster events.
3. The District Officer selects the relevant disaster event.
4. The system displays the affected districts and current response information for the selected event.
5. The District Officer selects the district that requires rescue deployment.
6. The system displays the rescue teams currently available for the selected district and their current status.
7. The District Officer selects a rescue team.
8. The District Officer enters the emergency response location and confirms the assignment.
9. The system checks that the selected rescue team is still available.
10. The system records the rescue assignment and changes the rescue team status from Available to Assigned.
11. The assigned mission becomes available to the Rescue Team Leader.
12. The Rescue Team Leader views the assigned mission.
13. When the response begins, the Rescue Team Leader updates the mission status to En Route.
14. The system records the latest mission status.
15. The District Officer views the updated rescue operation status on the dashboard.

Alternate Flows:

Selected rescue team is no longer available:

- The system detects that the selected team is no longer available before the assignment is confirmed.
- The system prevents the conflicting assignment and refreshes the available rescue-team list.
- The District Officer selects another available team and continues the assignment.

No rescue team is available in the selected district:

- The system informs the District Officer that no local rescue team is currently available.
- The District Officer may review permitted teams from another district or organization.
- If an available team is selected, the assignment continues. If no team is selected, the use case ends without creating an assignment.

Postconditions:

- A rescue assignment is created and stored for the selected disaster event, rescue team and emergency location.
- The selected rescue team status reflects the assignment and later mission updates.
- The Rescue Team Leader can view the assigned mission.
- The District Officer can view the latest synchronized rescue operation status.
- The assignment remains available for continued emergency response coordination.

Exception Flows:**Field connectivity is unavailable while updating mission status:**

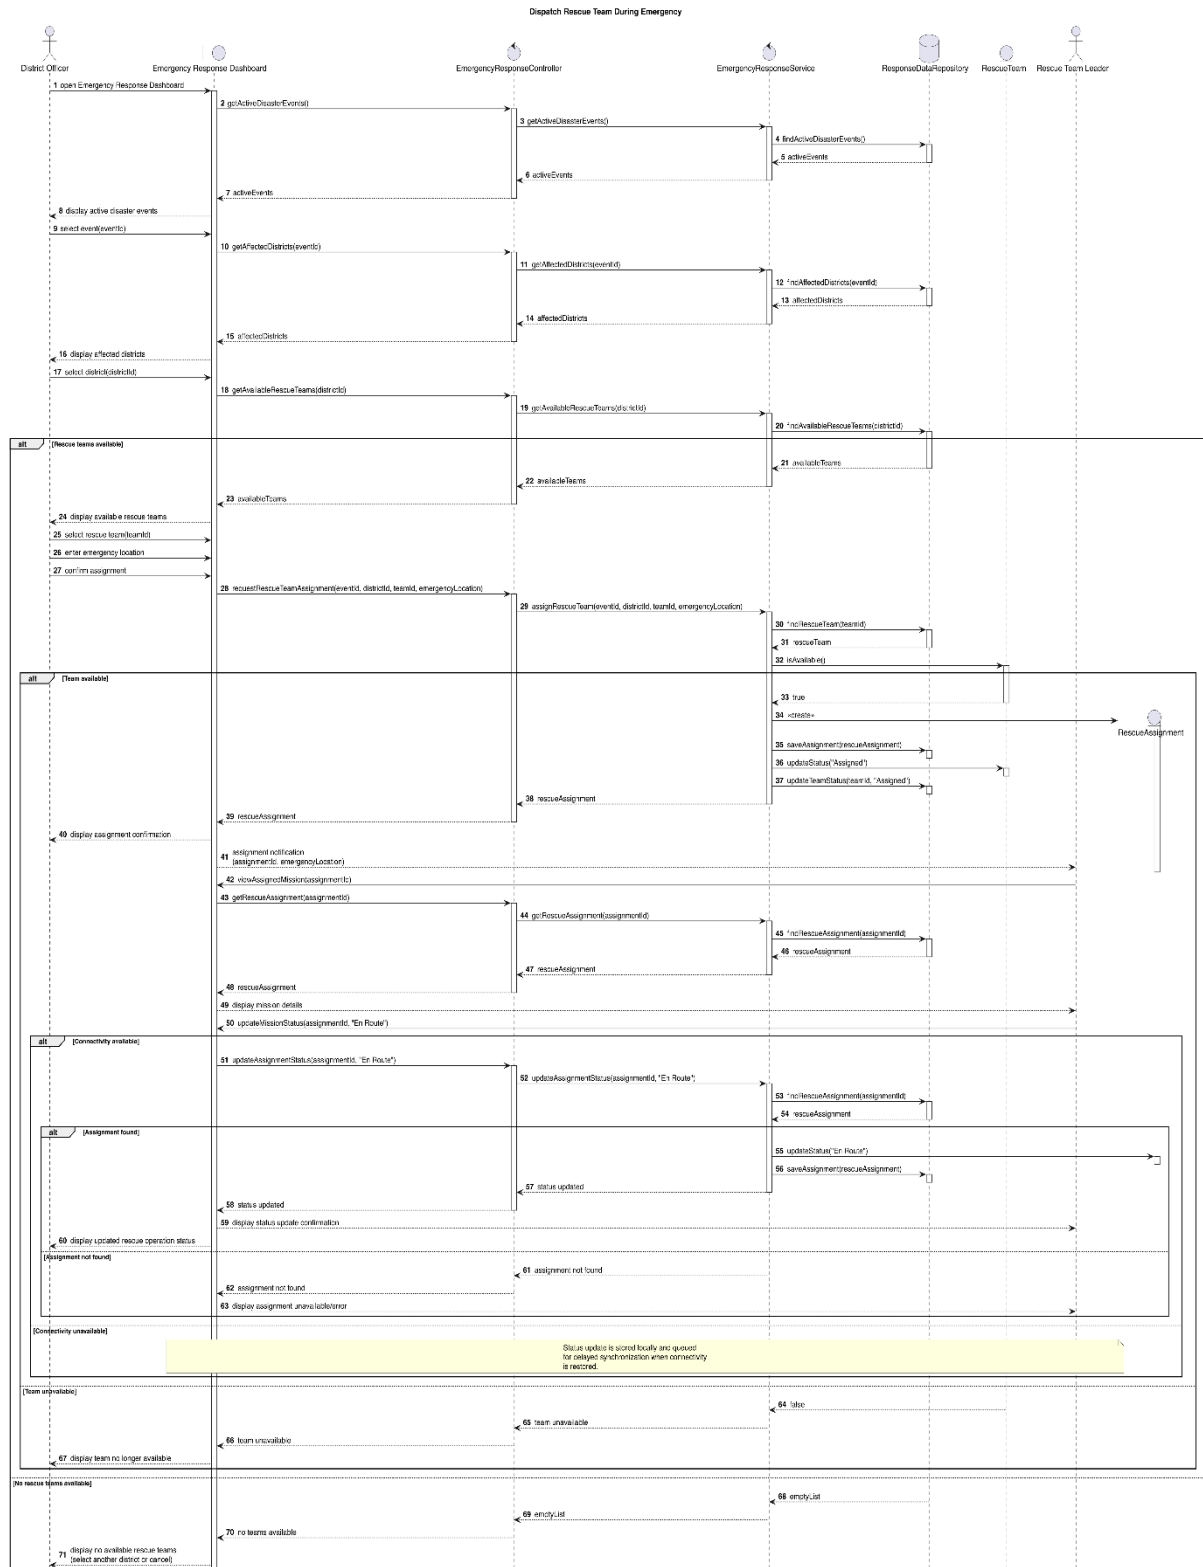

- The Rescue Team Leader attempts to update the mission status from the affected area.
- If offline capture is supported, the update is kept as pending until connectivity returns.
- The District Officer continues to see the last successfully synchronized status.
- When connectivity is restored, the pending status update is synchronized and displayed.

Rescue assignment cannot be stored:

- The system informs the District Officer that the assignment could not be recorded.
- The rescue team status remains unchanged and no assignment is created.
- The District Officer may retry the assignment when the system becomes available.

Use Case Scenario

Use Case: Post-Disaster Analysis & Reports

Description:

This use case scenario describes how a DMC Officer or Donor Organisation selects a completed disaster event and generates a statistical post-disaster report. The report shows the timeline of alerts issued, the number of citizens reached, shelter occupancy over time, and resource distribution by district so the response can be reviewed and future planning can be improved.

Preconditions:

- The actor can access the Disaster Analysis & Reporting function.
- The disaster event and its operational records have been recorded in the system.
- Alert delivery, shelter occupancy, and resource distribution data are available for analysis.
- Records captured during connectivity outages are synchronized, or their pending status is known.

Main Flow:

- The actor selects the Disaster Analysis & Reporting function.
- The system displays disaster events available for post-disaster analysis.
- The actor selects the disaster event to analyse.
- The system displays the selected event details and the available district scope.
- The actor selects all affected districts or a specific district and requests the report.
- The system retrieves alert records, citizen reach data, shelter occupancy records, and resource distribution records for the selected event.
- The system checks the available data for the requested analysis.
- The system compiles the alert timeline and calculates the number of citizens reached.
- The system compiles shelter occupancy over time and summarizes resource distribution by district.
- The system generates the statistical post-disaster report.
- The system displays the generated report for the actor to review.

Alternate Flows:**No disaster events available:**

- If no disaster events are available for post-disaster analysis, the system informs the actor.
- The operation ends without generating a report.

Specific district selected:

- The actor selects one affected district instead of all affected districts.
- The system limits the report to data related to the selected district and continues with report generation.

Postconditions:

- A statistical post-disaster report is generated for the selected disaster event.
- The report shows the alert timeline and the number of citizens reached.
- Shelter occupancy over time is presented in the report.
- Resource distribution is summarized by district.
- Any unavailable or pending data is clearly identified in the report.

Exception Flows:**Pending synchronization:**

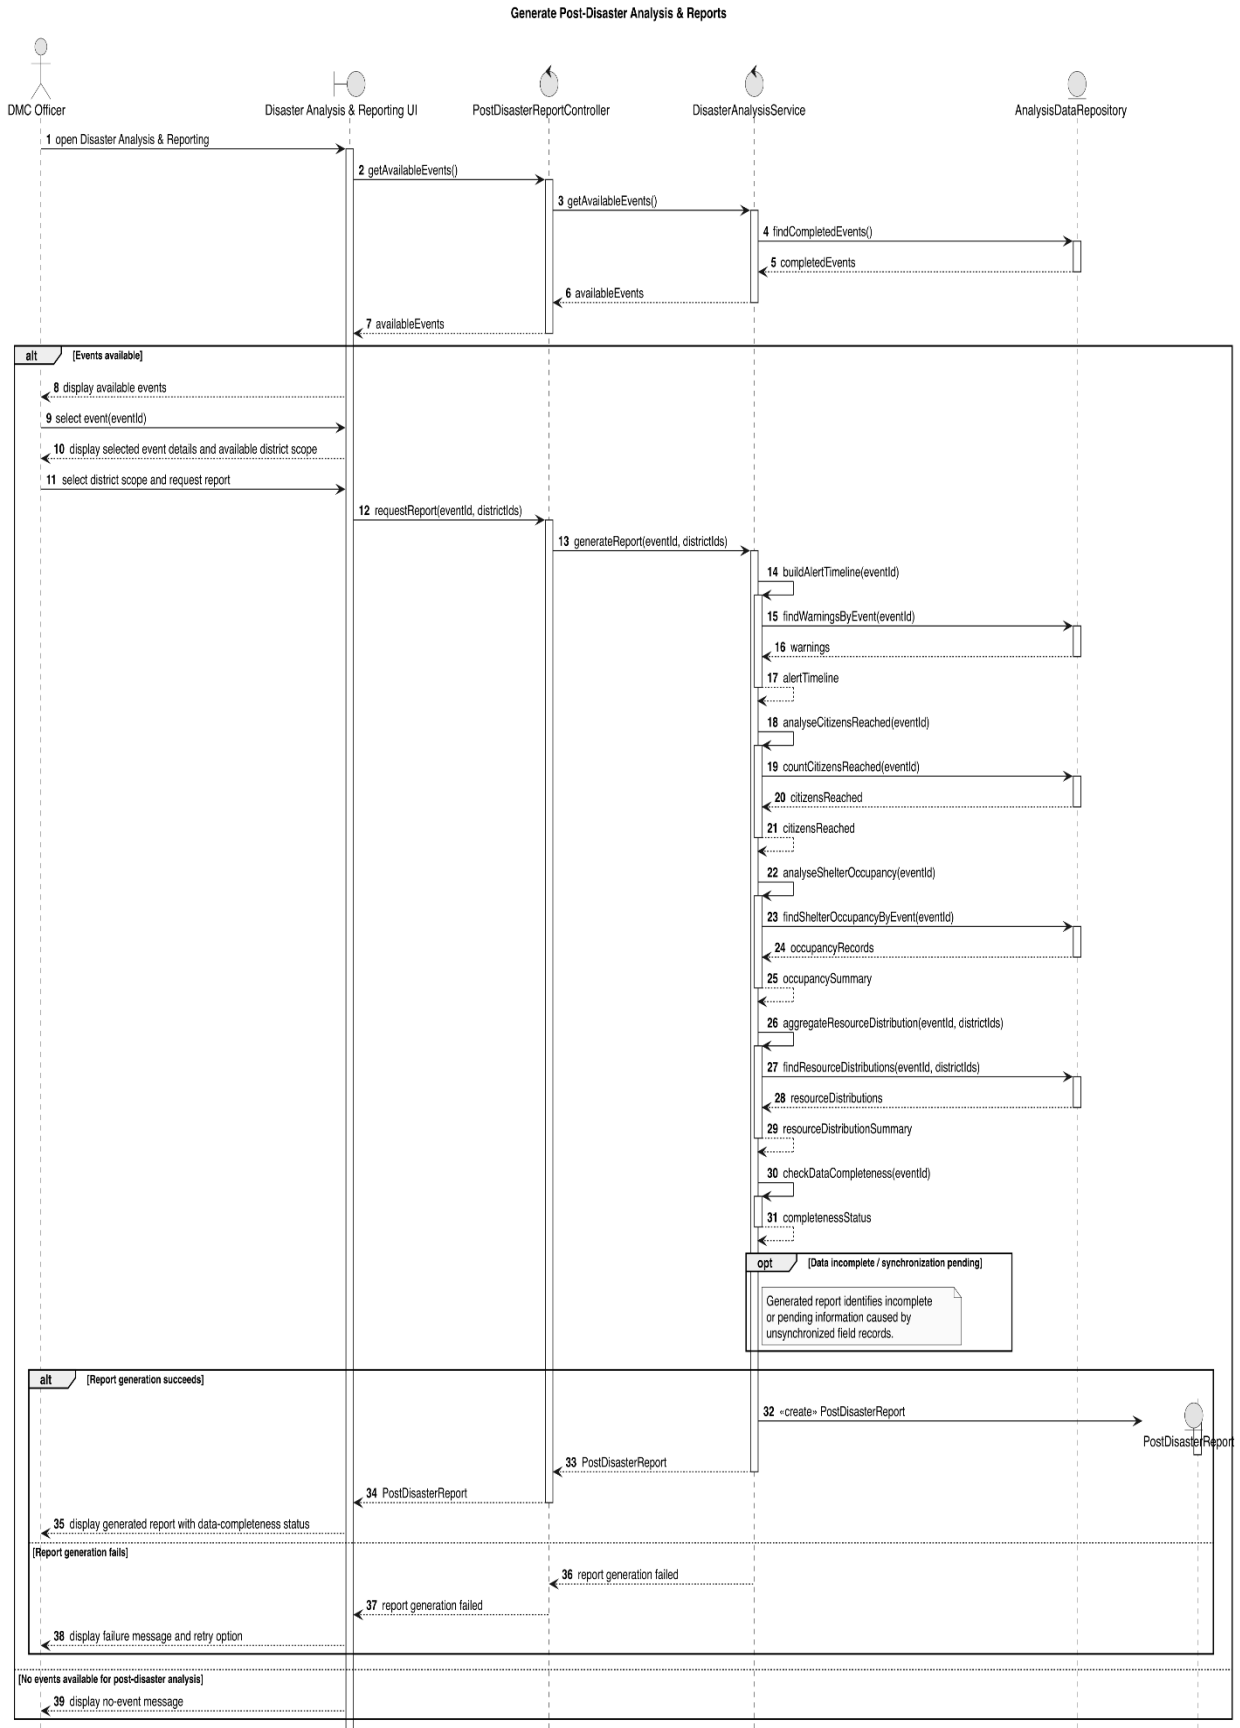

- Some event records are still pending synchronization because of an earlier connectivity outage.
- The system identifies the pending data and marks the affected report information as incomplete.
- The report is generated using the available synchronized data.

Report generation error:

- An error occurs while the system is processing the statistical report.
- The system does not display an invalid report and informs the actor that report generation failed.
- The actor may request the report again after the problem is resolved.

Use Case Scenario

Use Case Scenario — Issue and Disseminate Hazard Warning

Description

A DMC Duty officer generates/verifies and dispatches a specific area/river basin and time specific hazard warning in the affected region. Duty officer can choose hazard type, warning level and region to provide warnings, dissemination occurs using possible communication channels-push notification/SMS/audio alert. The system log a warning and status of it for better coordination and observation.

Primary Actor - Duty Officer

Supporting Actors - Hazard Information, Location Management System, Warning Database, Notification Service, SMS Service, Citizen

Preconditions

- DMC Duty Officer must be authenticated with valid credentials.
- The officer must have authorization to issue hazard warnings.
- Relevant hazard information must be available in the system.
- The affected district or river basin must be identifiable.
- Valid warning levels must be configured in the system.
- Warning notification services must be available.
- The system must have access to citizen/resident information for the affected area.

Main Flow

- DMC Duty Officer logs into the system and navigates to the Hazard Warning & Alert Management function.
- System displays the Issue Hazard Warning form.
- DMC Duty Officer enters the warning details, including:
- System retrieves the relevant hazard information from the Hazard Information / Monitoring System.
- System displays the retrieved hazard information to the officer for review.
- DMC Duty Officer selects the appropriate warning level, such as:
- System validates the selected warning level.
- DMC Duty Officer selects the affected area, such as a district or river basin.
- System validates the selected affected area.
- System displays a warning preview containing the hazard type, warning level, description, and affected area.
- DMC Duty Officer reviews the warning and confirms the warning issuance.
- System creates the hazard warning with the provided details.
- System stores the warning in the Warning Database and generates a unique warning ID.
- System identifies citizens/residents located within the selected affected district or river basin.
- System prepares the warning for dissemination to the identified citizens.
- System sends the warning through the available notification channels:
- Citizens receive the hazard warning through the available communication channels.
- Notification Service returns the dissemination status to the system.
- System records the dissemination status against the warning ID.
- System displays the final warning/dissemination status to the DMC Duty Officer.
- DMC Duty Officer receives confirmation that the warning has been successfully issued and disseminated.

Alternate Flows

- Invalid Warning Level

- System detects that the selected warning level is invalid or unavailable.
- System displays: "Invalid warning level. Please select a valid warning level."
- DMC Duty Officer selects another warning level.
- System validates the new selection.
- Main flow continues from Step 7.

- Invalid Affected Area

- System detects that the selected district or river basin is invalid.

- System displays: "Invalid affected area. Please select a valid district or river basin."
- DMC Duty Officer selects another affected area.
- System validates the new area.
- Main flow continues from Step 9.
- Multiple Notification Channels Available
 - System identifies multiple available dissemination channels.
 - System sends the warning through Push Notification, SMS, and Audible Alert simultaneously where applicable.
 - System collects the delivery status from each channel.
 - System records the combined dissemination status.
- Partial Dissemination Success
 - One or more notification channels successfully deliver the warning.
 - One channel fails to deliver the warning.
 - System records the status of each channel separately.
 - System marks the overall warning status as Partially Disseminated.
 - System allows the failed notification channel to be retried.
- Officer Modifies Warning Before Confirmation
 - DMC Duty Officer reviews the warning preview.
 - Officer identifies incorrect or incomplete information.
 - Officer modifies the warning details, warning level, or affected area.
 - System validates the updated information.
 - System generates an updated warning preview.
 - Officer confirms the warning.

Postconditions

- Hazard warning is successfully created and stored in the Warning Database.
- A unique warning ID is generated for the issued warning.
- Hazard type, warning level, description, and affected area are recorded.
- Citizens within the affected district or river basin are identified.
- Warning is disseminated through available notification channels.
- Push, SMS, and audible alert dissemination statuses are recorded.
- Overall warning dissemination status is stored in the system.
- DMC Duty Officer receives confirmation of the warning status.
- Warning information remains available for monitoring and future analysis.

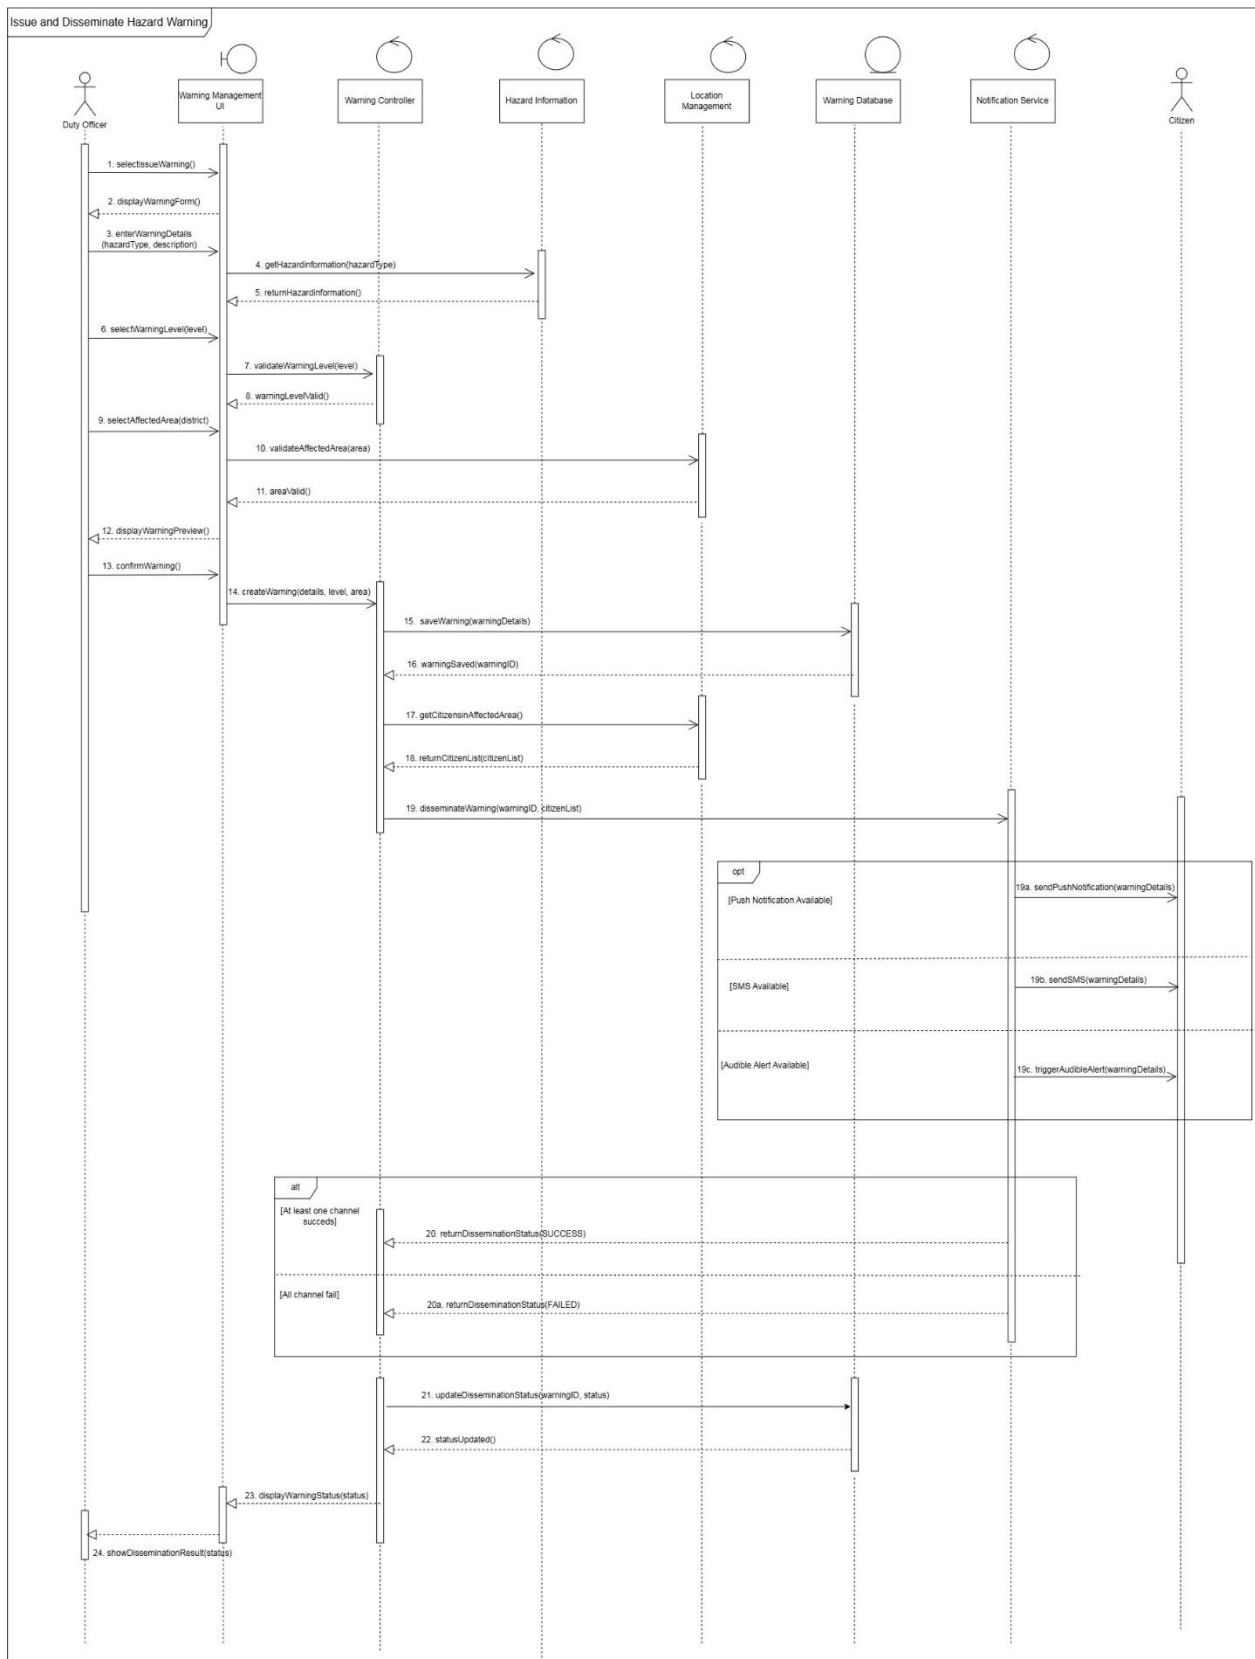

Exception Flows

- Hazard Information Unavailable
 - System cannot retrieve the required hazard information.
 - System displays: "Hazard information is currently unavailable. Please try again."
 - Officer can retry retrieving the information.
 - Warning issuance cannot proceed until sufficient hazard information is available.
- Warning Database Unavailable
 - System fails to store the warning.
 - System displays: "Warning could not be saved. Please try again."
 - System logs the database error.
 - Officer can retry the warning submission.
- Notification Service Unavailable

- System cannot connect to the Notification Service.
- System displays: "Notification service is temporarily unavailable."
- System records the warning as Pending Dissemination.
- Officer can retry dissemination when the service becomes available.
- SMS Service Failure
 - SMS service fails while disseminating the warning.
 - System records the SMS status as Failed.
 - System continues dissemination through other available channels.
 - System allows the SMS notification to be retried.
- Audible Alert Service Failure
 - Audible Alert Service cannot be reached.
 - System records the audible alert status as Failed.
 - System continues using available notification channels.
 - System logs the failure for technical monitoring.
- No Citizens Found in Affected Area
 - System finds no registered citizens/residents within the selected affected area.
 - System displays: "No registered recipients found for the selected area."
 - Warning remains stored in the system.
 - Officer can review or modify the affected area.
- Invalid Warning Details
 - System detects missing or invalid warning information.
 - System displays: "Please provide valid warning details before issuing the warning."
 - Officer corrects the required information.
 - System validates the information again before allowing issuance.

Use Case Scenario

Use Case Scenario — Submit and Verify Hazard Report

Description

This use case scenario describes the process by which a citizen or community disaster volunteer submits a hazard report with relevant details, supporting evidence, and GPS location. The submitted report is stored as pending verification and reviewed by a Duty Officer, who verifies or rejects the report. The reporter is then notified of the result.

Preconditions :

- The Disaster Management System is available.
- The citizen or community disaster volunteer can access the hazard reporting function.
- The reporter has observed a potential hazard.
- The reporter can provide the necessary hazard information.
- A Duty Officer has access to reports awaiting verification.

Main Flow :

- Citizen / Community Disaster Volunteer selects "Submit Hazard Report".
- System displays the hazard reporting form.
- Reporter enters the required hazard details.
- Reporter may attach supporting evidence such as a photograph.
- System captures the reporter's GPS location.
- Reporter submits the hazard report.
- System validates the submitted report.
- System stores the report with "Pending Verification" status.
- System makes the pending report available to the Duty Officer.
- Duty Officer selects "View Pending Reports".
- System displays the available pending hazard reports.
- Duty Officer reviews the hazard details, supporting evidence, and location.
- Duty Officer selects "Verify Report".
- System records the verification decision.
- System updates the report status to "Verified".
- System notifies the reporter of the verification result.
- Reporter receives the report result.

Alternate Flows**- Report Rejected:**

- Duty Officer reviews the submitted hazard report.
- Duty Officer determines that the report cannot be verified.
- Duty Officer selects "Reject Report".
- Duty Officer provides a reason for rejecting the report.
- System records the rejection decision and reason.
- System updates the report status to "Rejected".
- System notifies the reporter of the rejection.
- Reporter receives the report result.

- Supporting Evidence Not Provided:

- Reporter does not attach a photograph or other supporting evidence.
- System allows the report to proceed if the required information is available.
- System stores the report as "Pending Verification".
- Duty Officer reviews the report using the available information.

- Reporter Checks Submission Status:

- Reporter selects "Check Submission Status".
- System displays the current status of the submitted report.
- The status may be Pending Verification, Verified, or Rejected.

Postconditions**- If the report is verified:**

- The hazard report is stored in the system.
- The report status is "Verified".
- The verification decision is recorded.

- The reporter is notified of the result.
- The verified report can be used to support disaster warning and response decisions.

-If the report is rejected:

- The hazard report remains stored in the system.
- The report status is "Rejected".
- The rejection reason is recorded.
- The reporter is notified of the result.
- The rejected report is not used as a verified hazard report.

Exception Flows

- Network Unavailable:

- Reporter attempts to submit the hazard report while the network is unavailable.
- System cannot immediately send the report to the central server.
- System stores the report locally on the device.
- Report is marked as "Pending Synchronization".
- When network connectivity is restored, the system synchronizes the report.
- The report is stored as "Pending Verification".

- Invalid or Incomplete Hazard Details:

- System detects missing or invalid required information.
- System informs the reporter about the missing or incorrect information.
- Reporter corrects the information.
- Reporter resubmits the hazard report.
- System validates the report and continues the submission process.

- GPS Location Unavailable:

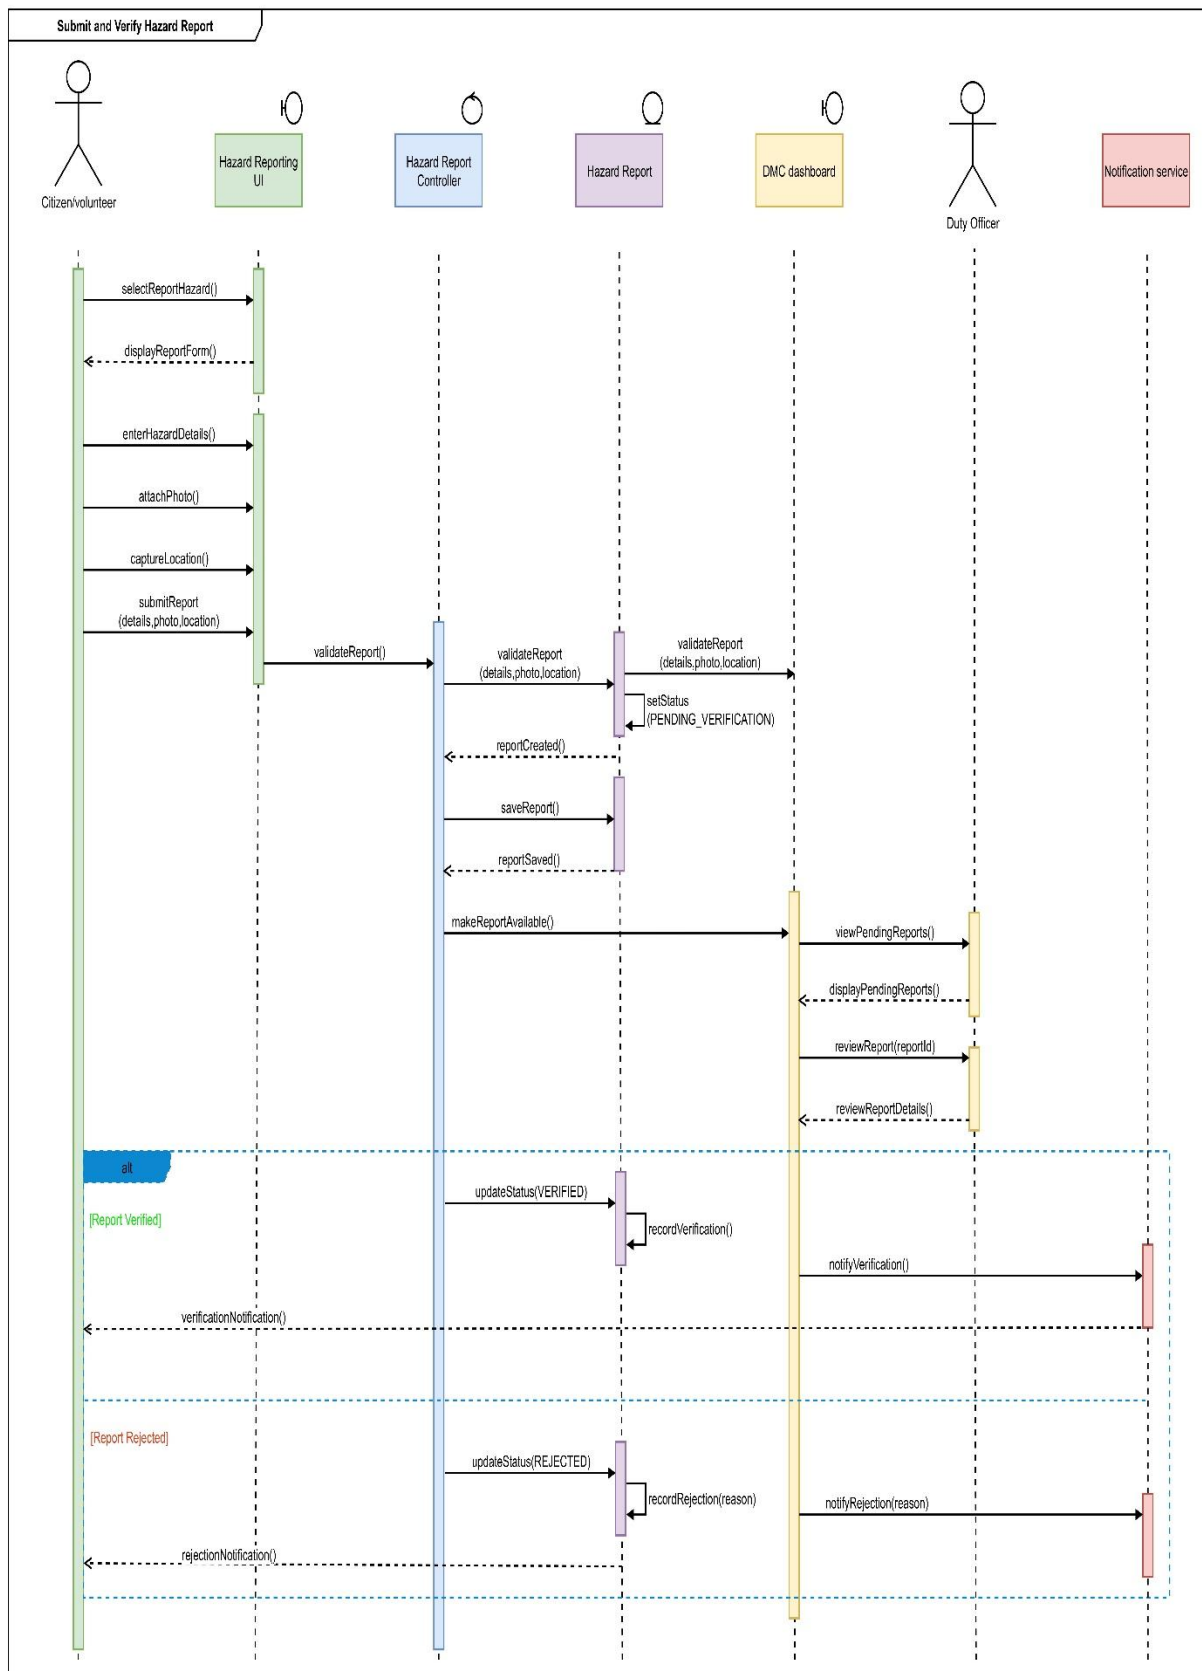

- System is unable to capture the reporter's GPS location.
- System informs the reporter that the location cannot be obtained.
- Reporter enables location services or retries location capture.
- System captures the location and continues the submission process.

- System Error:

- An error occurs while submitting or processing the report.
- System displays an error message to the reporter.
- The report is not considered successfully submitted unless it has been stored correctly.
- Reporter can retry the operation when the system becomes available.
